

ABSTRACT

5 A paint storage apparatus comprising a cap, a container divided into a plurality of
chambers, and a lid having a plurality of orifices is disclosed. The apparatus is preferably
substantially cylindrical and is uniformly formed from a homogenous material. When the
lid is fixed on the container, the orifices are aligned over the chambers, with one of the
plurality of orifices over each of the plurality of chambers. Further, when the lid and the
container are mated, the plurality of chambers in the container are sealed such that paint
cannot be interchanged between the chambers. The cap is configured to detachably
10 couple to the lid and prevent spillage and spoilage of paint stored within the container. In
addition, the cap and the lid preferably each further comprise tabs configured to facilitate
removal of the lid from the container and to facilitate removal of the cap from the lid.
